

RiskGPT: The Enterprise AI Platform for Regulated Work at BMO

RiskGPT was built to solve a problem productivity AI cannot solve:

In regulated environments, producing an answer is not enough — the answer must be provable.

Where Microsoft Copilot helps individuals work faster,

RiskGPT helps the bank operate smarter.

RiskGPT connects to internal data, automates regulated workflows, stores lineage, and produces evidence-backed output that can withstand audit, model validation, and regulatory examination.

Copilot drafts. RiskGPT proves.

The Work That Runs the Bank Is Not Linear — It's Investigative

Analysts and managers spend hours navigating SQL/parquet datasets, 200-page OSFI/SEC policy documents, SharePoint repositories of audit evidence, and Jira change logs.

RiskGPT does not replace expertise — it eliminates the searching, assembling, reconciling, and proving.

You think → RiskGPT executes.

MCP — Model Context Protocol (Internal Data Connectivity)

Most AI tools hallucinate because they guess.

RiskGPT does not guess — it connects.

Through MCP, RiskGPT plugs into BMO internal systems:

- Parquet and SQL tables
- SharePoint and Confluence
- Jira and ticketing workflows

Users no longer hunt for data. They ask the bank a question.

“Fetch yesterday’s exposure for Netting Set ABC and explain drivers.”

DAG Workflows — Business Processes Become Automations

Risk, Finance, and Audit processes are not one task — they are sequences.

Pull Data → Compute → Interpret → Narrate → Document → Store Evidence

RiskGPT turns steps into DAG Workflows:

- Modular
- Repeatable
- Configurable

Instead of writing scripts, teams define workflows as JSON.

RiskGPT executes the full process end-to-end.

Agents — Domain Specialists, Not Chatbots

Each agent is designed to perform regulated business work:

- CCR Exposure Agent
- Policy and Control Analysis Agent
- Audit Evidence Agent

Agents don’t chat.

Agents do work.

Knowledge Graph — Understanding BMO as a System

RiskGPT builds a graph database of BMO’s entities:

Trades → Facilities → Netting Sets → Exposures

Policies → Controls → Evidence

Instead of searching, RiskGPT traces.

Governance — Accuracy Isn't Assumed, It's Proven

RiskGPT includes:

- LLM-as-a-Judge (self-evaluation)
- Verified Responses (thumbs up/down)
- Response Memory (reuses correct answers)

RiskGPT doesn't just answer.

RiskGPT learns BMO.

Copilot + RiskGPT — Different Tools for Different Moments of Work

Copilot drafts, formats, summarizes.

RiskGPT computes, automates, proves.

They are complementary.

Copilot boosts personal productivity.

RiskGPT transforms the way the bank works.

Final Thought

The future of regulated work is not AI that writes.

It is AI that executes, proves, and learns.
